1. Introduction

Terra-Africa Consult cc was appointed by Aristida (Pty) Ltd to conduct the Agricultural Compliance Assessment for the proposed Aristida Photovoltaic (PV) Facility and Associated Infrastructure (from here onwards also referred to as the project). An assessment area of approximately 251 ha is being assessed as part of this EIA process.

The project applicant is Aristida PV (Pty) Ltd and the proposed development will be located approximately 5km north west of the town of Lichtenburg in the North West Province (see Figure 1). The solar PV facility will comprise several arrays of PV panels and associated infrastructure and will have a contracted capacity of up to 120MW. The development area is situated within the Ditsobotla Local Municipality within the Ngaka Modiri Molema District Municipality on Portion 7 of Farm Elandsfontein 34. The site is accessible via the R503, located south east of the development area.

An additional 120 MW PV facility (Themeda PV) is concurrently being considered on the project site (within Portion 7 of Farm Elandsfontein 34) and is being assessed through a separate Environmental Impact Assessment (EIA) process.

2. Details of the specialist

Mariné is a scientist registered with the South African Council for Natural Scientific Professions (SACNASP) and is specialised in the fields of Agricultural Science and Soil Science. Her SACNASP Registration Number is 400274/10. Mariné holds a BSc. degree in Agricultural Science (with specialisation in Plant Production) from the University of Pretoria and a MSc. Degree in Environmental Science from the University of the Witwatersrand.

She has consulted in the subject fields of soil, agriculture, pollution assessment and land use planning for the environmental sector of several African countries including Botswana, Mozambique, Democratic Republic of Congo, Liberia, Ghana and Angola. She has also consulted on the soil and agricultural assessment of a gas infrastructure project in Afghanistan. Mariné's project experience conducting assessments for renewable energy projects include solar and wind energy facilities in the Western, Northern and Eastern Cape as well as the North West, Free State and KwaZulu Natal Provinces. Her contact details are provided in Appendices 1 and 2 attached.

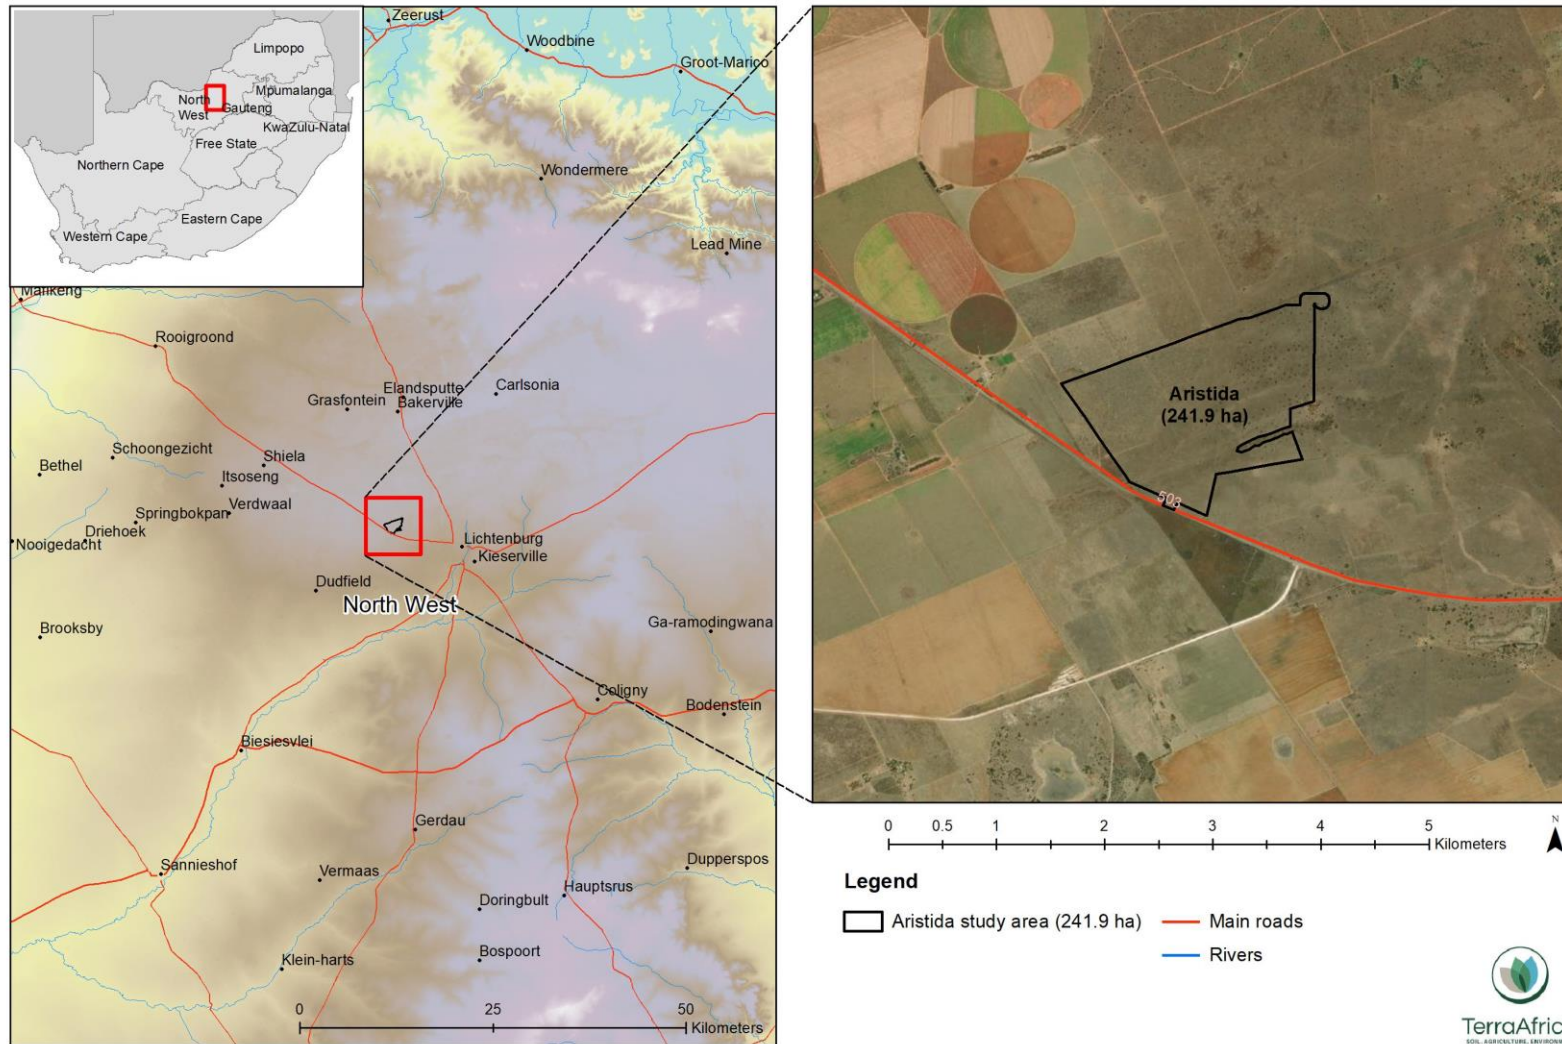

Figure 1: Locality of the proposed Aristida PV facility and associated infrastructure

3. Purpose and objectives of the compliance statement

The purpose of the Agricultural Compliance Statement, is to ensure that the sensitivity of the site from the perspective of agricultural production to the proposed development, is sufficiently considered. To meet this objective, site sensitivity verification must be conducted, of which the results must meet the following objectives:

- It must confirm or dispute the current land use and the environmental sensitivity as was indicated by the National Environmental Screening Tool.
- It must contain proof in the form of photographs of the current land use and environmental sensitivity pertaining to the study field.
- All data and conclusions are submitted together with the Environmental Impact Assessment Report (prepared in accordance with the NEMA regulations) for the proposed project.

According to GNR 320, the agricultural compliance statement that is submitted must meet the following requirements, it must:

- be applicable to the preferred site and the proposed development footprint;
- confirm that the site is of “low” or “medium” sensitivity for agriculture; and
- indicate whether or not the proposed development will have an unacceptable impact on the agricultural production capability of the site.

The following checklist is supplied as per the requirements of GNR 320, detailing where in the report the various requirements have been addressed:

Table 1 GNR 320 requirements of an Agricultural Compliance Statement (Low to Medium Sensitivity)

Requirement	Report reference
3.1. The compliance statement must be prepared by a soil scientist or agricultural specialist registered with the SACNASP.	Page 3 & Appendix 2
3.2. The compliance statement must:	Section 9
3.2.1. be applicable to the preferred site and proposed development footprint;	
3.2.2. confirm that the site is of "low" or "medium" sensitivity for agriculture; and	Section 10.5
3.2.3. indicate whether or not the proposed development will have an unacceptable impact on the agricultural production capability of the site.	Section 10.4 and Section 13
3.3. The compliance statement must contain, as a minimum, the following information:	Page 3, Appendices 1, 2 and 3
3.3.1. contact details and relevant experience as well as the SACNASP registration number of the soil scientist or agricultural specialist preparing the assessment including a curriculum vitae;	
3.3.2. a signed statement of independence;	Appendix 1

3.3.3. a map showing the proposed development footprint (including supporting infrastructure) with a 50m buffered development envelope, overlaid on the agricultural sensitivity map generated by the screening tool;	Figure 2
3.3.4. confirmation from the specialist that all reasonable measures have been taken through micro- siting to avoid or minimise fragmentation and disturbance of agricultural activities;	Section 12
3.3.5. a substantiated statement from the soil scientist or agricultural specialist on the acceptability, or not, of the proposed development and a recommendation on the approval, or not, of the proposed development;	Section 12
3.3.6. any conditions to which the statement is subjected;	Section 12
3.3.7. in the case of a linear activity, confirmation from the agricultural specialist or soil scientist, that in their opinion, based on the mitigation and remedial measures proposed, the land can be returned to the current state within two years of completion of the construction phase;	Not applicable
3.3.8. where required, proposed impact management outcomes or any monitoring requirements for inclusion in the EMP; and	Section 11
3.3.9. a description of the assumptions made as well as any uncertainties or gaps in knowledge or data.	Section 8
3.4. A signed copy of the compliance statement must be appended to the Basic Assessment Report or Environmental Impact Assessment Report.	Submitted as part of final report

4. Terms of Reference

In addition to the requirements stipulated in GNR 320, the following Terms of Reference, as stipulated by Aristida (Pty) Ltd, apply to the Agricultural Compliance Statement:

- to ensure a thorough assessment, that includes both the desktop assessment of databases and aerial photography; a description of the on-site verification of the agricultural potential of the area; and the soil forms present in the development area;
- identify and assess potential impacts on both agricultural potential and soil resulting from the proposed project;
- identify and describe potential cumulative soil, agricultural potential and land capability impacts resulting from the proposed project in relation to proposed and existing developments in the surrounding area; and
- recommend mitigation, management and monitoring measures, to minimise impacts and/or optimise benefits associated with the proposed project.

5. Legislative framework of the assessment

The report follows the protocols as stipulated for agricultural assessment in Government Notice 320 of 2020 (GNR 320). This Notice provides the procedures and minimum criteria for reporting in terms of Sections 24(5)(a) and (h) and 44 of the National Environmental Management Act (No. 107 of 1998) (NEMA). It replaces the previous requirements of Appendix 6 of the Environmental Impact Assessment Regulations of NEMA.

In addition to the specific requirements of GN320 for this study, the following South African legislation is also considered applicable to the interpretation of the data and conclusions made with regards to environmental sensitivity and the conservation of soil resources of the project area:

- the Conservation of Agricultural Resources Act (No 43 of 1983) (CARA) states that the degradation of the agricultural potential of soil is illegal. CARA requires the protection of land against soil erosion and the prevention of water logging and salinisation of soils by means of suitable soil conservation works to be constructed and maintained. The utilisation of marshes, water sponges and watercourses are also addressed; and
- the National Water Act (No 36 of 1998) (NWA) deals with the protection of water resources (i.e. wetlands and rivers). Hydric soils with wetland land capability are not part of the proposed development area and the NWA is therefore not applicable.

6. Agricultural Sensitivity

The combined Agricultural Sensitivity of the proposed project area was determined by using the National Environmental Screening Tool (www.screening.environment.gov.za). The screening report was generated on 7 July 2022. The requirements of GNR 320 stipulate that a 50m buffered development envelope must be assessed with the screening tool. The map depicted in Figure 2 shows the agricultural sensitivity of both the 251ha assessment area; and a buffered area of at least 2km around the proposed development.

The results provided by the screening tool indicate that approximately half of the development area consists of land with Medium agricultural sensitivity (refer to Figure 2). The area with Medium sensitivity is located mainly in the eastern and southern part of the development area. The remaining half of the development area consists of land with High agricultural sensitivity. The area has been assigned High sensitivity since the field crop boundary data indicate that rainfed annual crops or pastures are cultivated in this area (see Figure 11) and that it has land capability that is Moderate-High (Class 09) (see Figure 8).

However, during the Scoping Phase of the Environmental Impact Assessment process, it was confirmed that the area has last been cultivated in 1994 and that Smuts finger grass was established in the area because of the low yields obtained from crop farming in the area. The area indicated as High is therefore considered more likely to have Medium to Low agricultural sensitivity.

The access road area has Medium agricultural sensitivity according to the screening report (Figure 2). The areas south and east of the project area consist mainly of land with Medium sensitivity while the area west and north of the project area is land with High and Very High sensitivity because of rainfed and irrigated crop production the area.

Figure 3 Presence of High Potential Agricultural Areas around the Aristida solar PV facility development area (DALRRD, 2019)

In alignment with the CARA, the Department of Agriculture, Land Reform and Rural Development (DALRRD) developed spatial data that depict High Potential Agricultural Areas (HPAAs) of the different provinces of South Africa (DALRRD, 2019). According to the DALRRD, these areas can be defined as: *“large, relative homogeneous portions of high value agricultural land that has the potential to sustainably, in the long-term, contribute significantly to the production of food.”*

The data layer of the HPAA's of North West Province shows that the proposed project area falls outside of any HPAA (refer to Figure 3). It borders on a Category B irrigated HPAA (IR) along the northern and western boundaries. The project area is also located 800 m to 1.5 km north east of a Category B rainfed HPAA (RF). Since the development footprint will remain within the boundaries of the Aristida PV development area, it will not affect or fragment any of the nearby HPAA's.

7. Methodology

The different steps that were followed to gather the information used for the compilation of this report is outlined below. The methodology is in alignment with the requirements of GNR 320.

7.1 Assessment of available data

The most recent aerial photography of the area available from Google Earth was obtained. The satellite imagery was used to analyse the terrain of the proposed project area and the surrounding area. The analysis considered the slope, typical terrain units and landscape features, such as existing roads, farm infrastructure and areas where land degradation may be present. The proposed development area was also superimposed on four different raster data sets obtained from the National Department of Agriculture, Land Reform and Rural Development (DALRRD). The data sets are:

- The Refined Land Capability Evaluation Raster Data for South Africa that was developed using a spatial evaluation modelling approach (DALRRD, 2016).
- The long-term grazing capacity for South Africa 2018 that present the long-term grazing capacity of an area with the understanding that the veld is in a relatively good condition (South Africa, 2018).
- The North West Field Crop Boundaries show crop production areas may be present within the development area. The field crop boundaries include rainfed annual crops, non-pivot and pivot irrigated annual crops, horticulture, viticulture, old fields, small holdings and subsistence farming (DALRRD, 2019).
- The High Potential Agricultural Areas for Cultivation: North West Province, 2019 are large, relatively homogeneous areas of land within the province regarded as having high potential and capability to contribute towards food production in both the province and the country (DALRRD, 2019).

7.2 Site assessment

The site visit was conducted on 4 and 5 April 2022. The soil profiles were examined to a maximum depth of 1.5m using a hand-held auger. Observations on site were made regarding soil texture, structure, colour and soil depth at each survey point. A cold 10% hydrochloric acid solution was used on site to test for the presence of carbonates in the soil. A hand-held Garmin GPS was used to log the coordinates of each of the survey points. The position of the survey points is shown in Figure 4. The soils are described using Soil Classification: A Natural and Anthropogenic System for South Africa (Soil Classification Working Group, 2018).

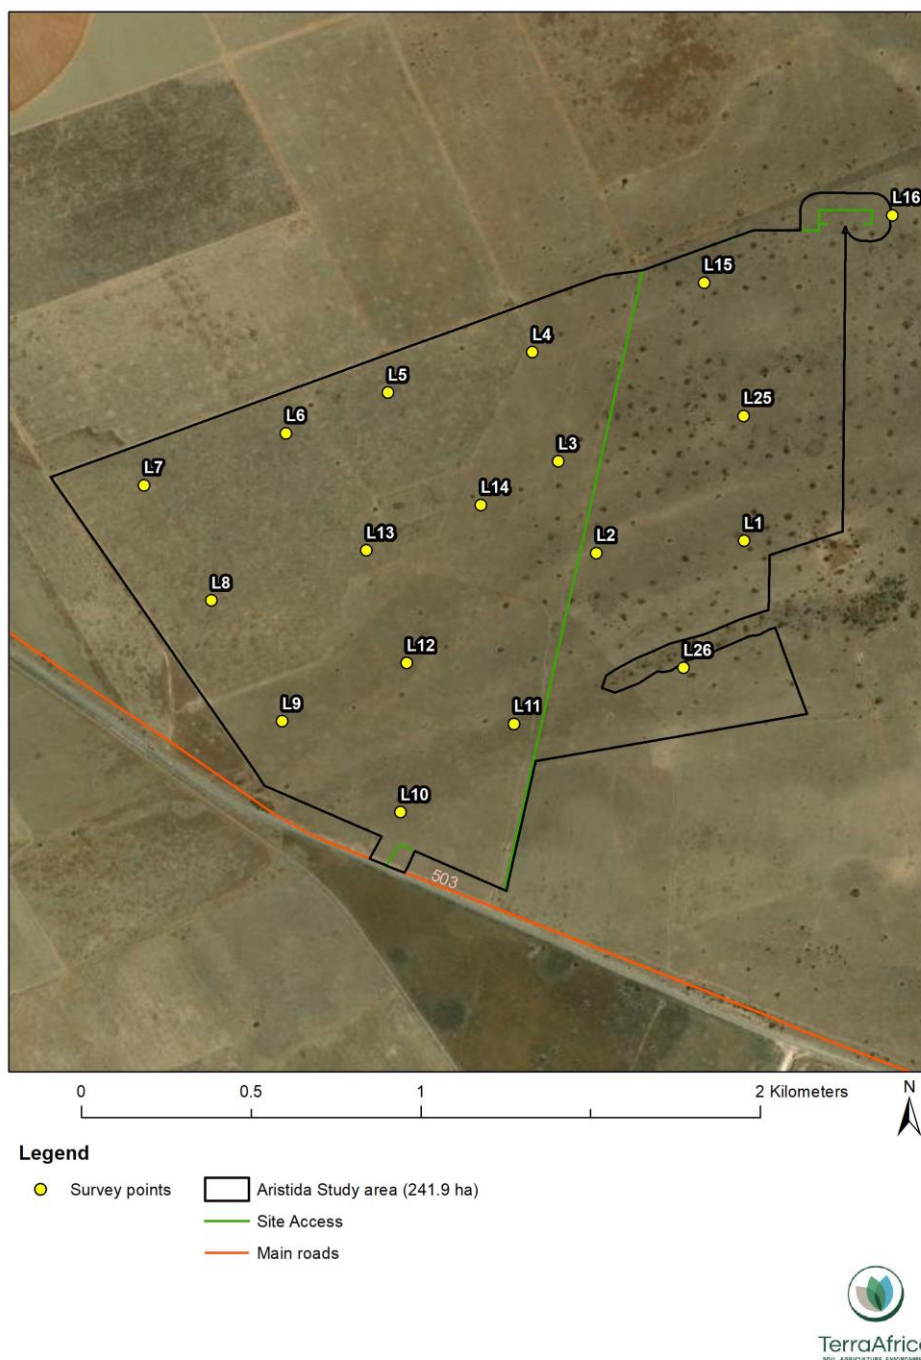

Figure 4 Locality of survey points within the Aristida project area

Other observations made during the site visit include recording the presence of farm buildings, cattle handling facilities and water troughs. The larger area around the study area was also assessed by driving through the area to gain an understanding of the agro-ecosystem within which the study area functions. Photographic evidence of soil properties, current land uses and farm infrastructure were taken with a digital camera and presented in Section 9 of the report.

7.3 Impact assessment methodology

The direct, indirect and cumulative impacts associated with the project have been assessed in terms of the following criteria:

- the **nature**, including a description of what causes the effect, what will be affected and how it will be affected;
- the **extent**, wherein it will be indicated whether the impact will be local (limited to the immediate area or site of development) or regional; and a value between 1 and 5 will be assigned as appropriate (with 1 being low and 5 being high);
- the **duration**, wherein it will be indicated whether:
 - the lifetime of the impact will be of a very short duration (0–1 years) – assigned a score of 1;
 - the lifetime of the impact will be of a short duration (2-5 years) - assigned a score of 2;
 - medium-term (5–15 years) – assigned a score of 3;
 - long term (> 15 years) - assigned a score of 4; or
 - permanent - assigned a score of 5;
- the **magnitude**, quantified on a scale from 0-10, where 0 is small and will have no effect on the environment; 2 is minor and will not result in an impact on processes; 4 is low and will cause a slight impact on processes; 6 is moderate and will result in processes continuing but in a modified way; 8 is high (processes are altered to the extent that they temporarily cease); and 10 is very high and results in complete destruction of patterns and permanent cessation of processes;
- the **probability of occurrence**, describing the likelihood of the impact actually occurring. Probability will be estimated on a scale of 1–5, where 1 is very improbable (probably will not happen), 2 is improbable (some possibility, but low likelihood), 3 is probable (distinct possibility), 4 is highly probable (most likely) and 5 is definite (impact will occur regardless of any prevention measures);
- the **significance**, determined through a synthesis of the characteristics described above and can be assessed as low, medium or high;
- the **status**, described as either positive, negative or neutral;
- the degree to which the impact can be reversed;
- the degree to which the impact may cause irreplaceable loss of resources; and
- the *degree* to which the impact can be *mitigated*.

The **significance** is calculated by combining the criteria in the following formula:

$$S=(E+D+M)P$$

S = Significance weighting

E = Extent

D = Duration

M = Magnitude

P = Probability

The **significance weightings** for each potential impact are as follows:

- < 30 points: Low (i.e. where this impact would not have a direct influence on the decision to develop in the area);
- 30-60 points: Medium (i.e. where the impact could influence the decision to develop in the area unless it is effectively mitigated); and
- 60 points: High (i.e. where the impact must have an influence on the decision process to develop in the area).

8. Study gaps, limitations and assumptions

All assumptions made with the interpretation of the baseline results and anticipated impacts, are listed below:

- it is assumed that the development footprint will be within the project area of up to 190ha that was assessed in this report;
- it is also assumed that the impacts of the grid connection will be assessed in a separate report as part of a Basic Assessment process;
- it is assumed that the project area will be fenced off and excluded as land available for any future farming activities; and
- it is further assumed that the activities for the construction and operation of the infrastructure are limited to that typical for the construction and operation of a solar PV facility, inclusive of the infrastructure listed in Section 10.1.

The following limitations is part of the assessment:

- the anticipation and rating of impacts are based on the report author's knowledge and experience on the nature of construction and operation of PV facilities. Therefore, it is done as accurately as possible but must not be considered as absolute measures.

No other information gaps, limitations and assumptions have been identified.

9. Baseline description

9.1 Soil properties

The soil profiles classified within the Aristida development area consist of the Mispah, Carolina, Clovelly and Vaalbos forms. The positions of the soil forms are depicted in Figure 5 and a description of each soil form is provided following Figure 5.

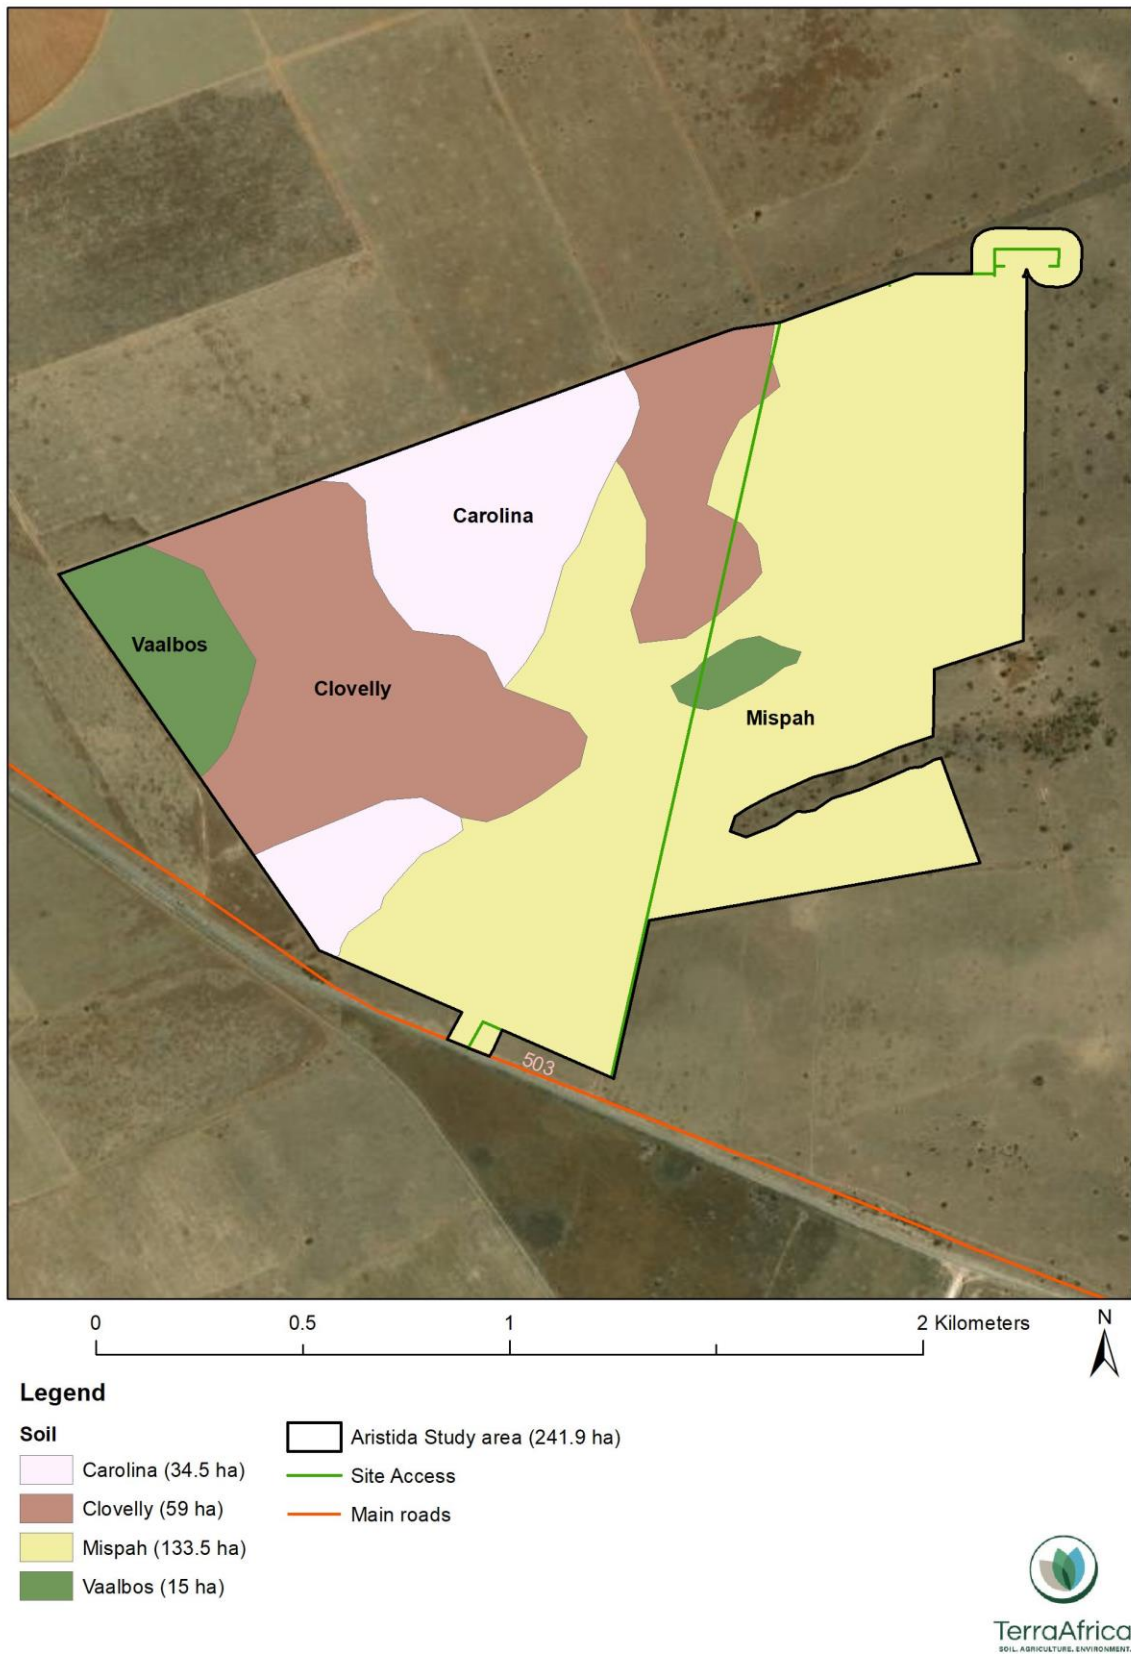

Figure 5 Soil classification map of the Aristida PV facility

Vaalbos soils

The Vaalbos soils consist of chromic (red) topsoil with sandy-loam texture that overlies a red apedal horizon. The red apedal horizon is limited in soil depth by the presence of hard rock that are mostly solid, at depths between 0.5m and 0.8m. The Vaalbos soils are present in two areas within the project area that cover 15 ha of the development area.

Figure 6 Vaalbos soils within the Aristida project area

Clovelly soils

Two areas (that combinedly measure about 59 ha) of the Clovelly soil form are present in the Aristida PV development area, one area along the northern boundary and the other along the western boundary. The Clovelly soils consist of bleached topsoil with sandy-loam texture that overlies a yellow-brown apedal horizon, also with sandy-loam texture. The yellow-brown apedal horizon is limited in soil depth by the presence of lithic material at 0.6 m deep.

Carolina soils

Two areas of the Carolina soil form is present in the Aristida PV project area. The Carolina soils consist of bleached topsoil with sandy-loam texture that overlies a yellow-brown apedal horizon, also with sandy-loam texture. The yellow-brown apedal horizon is limited in soil depth by the presence of hard rock at 0.4 m deep.

Mispah soils

The Mispah soil form is present at 133.5 ha of the Aristida project area. The Mispah soils have shallow soil depth (0.05 to 0.30m) and consist of orthic topsoil (both chromic red and bleached) on solid and fractured rock. In some areas, the solid rock is visible on the surface as rock outcrops (as shown in Figure 7).

Figure 7 Solid rock visible on surface of Mispah soils

9.2 Land capability

The position of the different land capability classes within the development area, are depicted in

Figure 8. The land capability classes of the Aristida PV development area can be divided into two categories i.e. land with capability for rainfed crop production that has Moderate-High (Class 09) land capability in the north western half of the site. The south eastern half consists of land suitable for livestock farming but marginal to no suitability for rainfed crop production. This area consists of a combination of land capability classes ranging from Low-Moderate (Class 06) to Moderate (Class 08). The area classified as land with Moderate-High (Class 09) land capability aligns largely with the area where the Vaalbos, Clovelly and Carolina soils are located (see Figure 5).

Figure 8 Land capability classification of the Aristida PV facility and associated infrastructure (data source: DALRRD, 2016)

9.3 Agricultural potential

The Aristida PV development area can has soil with Low and Moderate agricultural potential. The area with Low agricultural potential is where the Mispah soils are present (133.5 ha). Low agricultural potential has been assigned because of the shallow soil depth that limits root growth and water storage capacity within these profiles.

The areas with the Carolina, Clovelly and Vaalbos soils, have Low-Moderate to Moderate agricultural potential (a total area of 108.5 ha). Although the profiles are slightly deeper and are more suitable for crop production, there are still limitations to the use of these soils for crop production. The soil depth of these profiles ranges between 0.4m and 0.8m and the shallower areas have limited capacity for water storage and crop root development.

The limited agricultural potential of these areas has been confirmed by the landowner. According to the landowner, the area where the Carolina, Clovelly and Vaalbos soils are present, were used for rainfed crops until 1994. In 1995, these fields were converted to grazing areas through the establishment of Smuts finger grass (*Digitaria eriantha*). The reason for the conversion was that the farmer that the crop yield from these fields were too low to be financially viable. These areas were considered better suited to extensive livestock production, which is also the current land use of the entire site.

Following the metadata layer obtained from DALRRD, the long-term grazing capacity of the entire project area is 8 ha/LSU (see Figure 10). The ideal grazing capacity is an indication of the long-term production potential of the vegetation layer growing in an area. More specifically, it relates to its ability to maintain an animal with an average weight of 450 kg (defined as 1 Large Stock Unit (LSU)), with an average feed intake of 10 kg dry mass per day over the period of approximately a year. This definition includes the condition that this feed consumption should also prevent the degradation of the soil and the vegetation. The grazing capacity is therefore expressed in number of hectares per LSU (ha/LSU) (DALRRD, 2018).

Using the long-term grazing capacity of 8ha/LSU, the PV development area of 251 ha can provide forage to 31 head of cattle. The grazing capacity is moderate to moderate-high in comparison to the grazing capacity of the rest of the country. The vegetation consists of a mixture of grasses as well as *Vachelia* and *Searsia* species.

Legend

| Low (133.5 ha) | Main roads |

Figure 9 Agricultural potential of the Aristida development area

Figure 10 Grazing capacity of the proposed Aristida PV development area (data source: DALRRD, 2018)

9.4 Sensitivity analysis

Following the consideration of all the desktop and gathered baseline data above, the findings of the report differ with the results of the Environmental Screening Tool. Approximately 55% of the development area consists of shallow Mispah soils that range in depth between 0.05 and 0.30m. These soils have Low agricultural potential and is not suitable for rainfed crop production.

The remaining 45% of the development area consists of Vaalbos, Clovelly and Carolina soils that have deeper effective soil depth, between 0.4 and 0.8m deep. However, these soils also have limitations to crop production and has Low-Moderate to Moderate agricultural potential.

The limitations of the Vaalbos, Clovelly and Carolina soils have been confirmed by the landowner. Even though these soils largely coincides with an area that has been delineated as a crop field with either rainfed crops or planted pastures according to DALRRD (2019) (refer to Figure 11), the landowner stated that the area has not been used for crop production since 1995 and these areas were planted with Smuts finger grass (*Digitaria eriantha*). No crops has been produced again in this area for during the past 27 years.

No irrigation infrastructure, such as centre pivots or drip irrigation, are present within the project area and irrigated agricultural is currently not practiced in the area. The area is currently used for livestock farming only and the proposed Aristida PV development area can support 22 head of cattle at the long-term grazing capacity of 8ha/LSU (DALRRD, 2018).

Considering the soil properties, agricultural potential as well as the current land use of the development area, 133.5 ha of the area has **Low Agricultural Sensitivity**, and 108.5 ha has **Medium Agricultural Sensitivity** (see Figure 12).

10. Impact assessment

10.1 Project description

An assessment area of approximately 251 ha is being assessed as part of this EIA process and the infrastructure associated with the 120 MW facility includes:

- PV modules and mounting structures (monofacial or bifacial) with fixed, single or double axis tracking mounting structures;
- Inverter-station, transformers and internal electrical reticulation (underground cabling where practical);
- Battery Energy Storage System (BESS);
- Site and internal access roads (up to 10 m wide);
- Auxiliary buildings (MV switch room, gate-house and security, control centre, office, warehouse, canteen & visitors centre, staff lockers etc.);
- Temporary and permanent laydown area;
- Perimeter fencing and security infrastructure;
- Rainwater Tanks; and
- Grid connection solution, including:
 - Medium-voltage cabling between the project components and the facility substation; and
 - Up to 132 kV facility substation.

The proposed layout of the project infrastructure, superimposed on the delineated agricultural sensitivity of the area, is shown in Figure 12.

10.2 Impact significance rating

The most significant impacts of the proposed project on soil and agricultural productivity will occur during the construction phase when the vegetation is removed and the soil surface is prepared for the delivery of materials and erection of the infrastructure. During the operational phase, the risk remains that soil will be polluted by the waste generated or in the case of a spill incident. During the decommissioning phase, soil will be prone to erosion when the infrastructure is removed from the soil surface.

Below follows the rating of the significance of each of the impacts for each of the project phases.

10.2.1 Construction phase

Impact: Change in land use from livestock farming to energy generation

Nature: Prior to construction of the project infrastructure, the PV development area will be fenced off and livestock farming will be excluded from 175.8a of land. The area where the access road will be constructed will be stripped of vegetation and will no longer be suitable for livestock grazing.

	Without mitigation	With mitigation
Extent	Local (1)	Local (1)
Duration	Medium duration (3)	Medium duration (3)
Magnitude	Moderate (6)	Low (4)
Probability	Definite (4)	Definite (4)
Significance	Medium (40)	Medium (32)
Status (positive or negative)	Negative	Negative
Reversibility	Moderate	Moderate
Irreplaceable loss of resources?	Yes	Yes
Can impacts be mitigated?	No	N/A
Mitigation:		
<ul style="list-style-type: none"> Vegetation clearance must be restricted to areas where infrastructure is constructed. No materials removed from development area must be allowed to be dumped in nearby livestock farming areas. Prior arrangements must be made with the landowners to ensure that livestock and game animals are moved to areas where they cannot be injured by vehicles traversing the area. Access to areas outside of the authorised development footprint should be strictly prohibited. All left-over construction material must be removed from site once construction on a land portion is completed. No open fires made by the construction teams are allowable during the construction phase. 		
Residual Impacts:		
The residual impact from the construction of the Aristida PV Facility and Associated Infrastructure is considered medium.		
Cumulative Impacts:		
Any additional infrastructure development in support of the Aristida PV Facility, will result in additional areas where grazing veld will be disturbed.		

Impact: Soil erosion

Nature: All areas where vegetation is removed from the soil surface in preparation for the infrastructure construction will result in exposed soil surfaces that will be prone to erosion. Both wind and water erosion are a risk, as the area falls within a region that experiences thunderstorms in the summer months and sometimes strong winds during the dry winter months, especially August and September.		
	Without mitigation	With mitigation
Extent	Local (1)	Local (1)
Duration	Medium-term (3)	Medium-term (3)
Magnitude	Moderate (6)	Low (4)
Probability	Probable (3)	Improbable (2)
Significance	Medium (30)	Low (16)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Low
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated?	Yes	N/A
Mitigation:		
<ul style="list-style-type: none"> Land clearance must only be undertaken immediately prior to construction activities and only within the development footprint; Unnecessary land clearance must be avoided; Level any remaining soil removed from excavation pits (where the PV modules will be mounted) that remained on the surface, instead of allowing small stockpiles of soil to remain on the surface; Where possible, conduct the construction activities outside of the rainy season; and Stormwater channels must be designed to minimise soil erosion risk resulting from surface water runoff. 		
Residual Impacts:		
The residual impact from the construction and operation of the project on the susceptibility to erosion is considered low.		
Cumulative Impacts:		

Any additional infrastructure development in support of the project will result in additional areas exposed to soil erosion through wind and water movement.

Impact: Soil compaction

Nature: The clearing and levelling of land for construction of the infrastructure will result in soil compaction. In the area where the access roads and substation will be constructed, topsoil will be removed, and the remaining soil material will be deliberately compacted to ensure a stable surface prior to construction.

	Without mitigation	With mitigation
Extent	Local (1)	Local (1)
Duration	Medium-term (3)	Medium-term (3)
Magnitude	Moderate (6)	Low (4)
Probability	Probable (3)	Improbable (2)
Significance	Medium (30)	Low (16)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Low
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated?	Yes	N/A

Mitigation:

- Vehicles and equipment must travel within demarcated areas and not outside of the construction footprint;
- Unnecessary land clearance must be avoided;
- Materials must be off-loaded and stored in designated laydown areas;
- Where possible, conduct the construction activities outside of the rainy season; and
- Vehicles and equipment must park in designated parking areas.

Residual Impacts:

The residual impact from the construction and operation of the project on soil compaction is considered low.

Cumulative Impacts:

Any additional infrastructure development in support of the project, will result in additional areas exposed to soil compaction.

Impact: Soil pollution

During the construction phase, construction workers will access the land for the preparation of the terrain and the construction of the thermal plant and access road. Potential spills and leaks from construction vehicles and equipment and waste generation on site can result in soil pollution.

Nature: The following construction activities can result in the chemical pollution of the soil:

1. Petroleum hydrocarbon (present in oil and diesel) spills by machinery and vehicles during earthworks and the removal of vegetation as part of site preparation;
2. Spills from vehicles transporting workers, equipment, and construction material to and from the construction site;
3. The accidental spills from temporary chemical toilets used by construction workers;
4. The generation of domestic waste by construction workers;
5. Spills from fuel storage tanks during construction;
6. Pollution from concrete mixing;
7. Pollution from road-building materials; and
8. Any construction material remaining within the construction area once construction is completed.

	Without mitigation	With mitigation
Extent	Local (1)	Local (1)
Duration	Short-term (2)	Short-term (2)

Magnitude	Moderate (6)	Low (4)
Probability	Low (4)	Improbable (2)
Significance	Medium (36)	Low (14)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Low
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated?	Yes	N/A
Mitigation:		
<ul style="list-style-type: none"> Maintenance must be undertaken regularly on all vehicles and construction/maintenance machinery to prevent hydrocarbon spills; Any waste generated during construction must be stored into designated containers and removed from the site by the construction teams; Any left-over construction materials must be removed from site; The construction site must be monitored by the Environmental Control Officer (ECO) to detect any early signs of fuel and oil spills and waste dumping; Ensure battery transport and installation by accredited staff / contractors; and Compile (and adhere to) a procedure for the safe handling of battery cells during transport and installation. 		
Residual Impacts:		
The residual impact from the construction and operation of the proposed project will be low to negligible.		
Cumulative Impacts:		
Any additional infrastructure that will be constructed to strengthen and support the operation of the Aristida PV facility and waste not removed to designated waste sites will increase the cumulative impacts associated with soil pollution in the area.		

10.2.2 Operational phase

Impact: Soil erosion

During the operational phase, staff and maintenance personnel will access the project area daily. The following impacts on soil are expected for this phase:

Nature: The areas where vegetation was cleared will remain at risk of soil erosion, especially during a rainfall event when runoff from the cleared surfaces will increase the risk of soil erosion in the areas directly surrounding the project area.		
	Without mitigation	With mitigation
Extent	Local (1)	Local (1)
Duration	Medium-term (3)	Medium-term (3)
Magnitude	Moderate (6)	Low (4)
Probability	Probable (3)	Improbable (2)
Significance	Medium (30)	Low (16)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Low
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated?	Yes	N/A
Mitigation:		
<ul style="list-style-type: none"> The area around the project, including the internal access roads, must regularly be monitored to detect early signs of soil erosion on-set; and If soil erosion is detected, the area must be stabilised using geo-textiles and facilitated re-vegetation. 		
Residual Impacts:		
The residual impact from the operation of the project on the susceptibility to erosion is considered low.		
Cumulative Impacts:		

Any additional infrastructure that will be constructed to strengthen and support the operation of the project will result in additional areas exposed to soil erosion through wind and water movement.

Impact: Soil pollution

Nature: During the operational phase, potential spills and leaks from maintenance vehicles and equipment and waste generation on site can result in soil pollution. Also, any spillages around the workshop area or damaged infrastructure, such as inverters and transformers, can be a source of soil pollution.		
	Without mitigation	With mitigation
Extent	Local (1)	Local (1)
Duration	Short-term (2)	Short-term (2)
Magnitude	Moderate (6)	Low (4)
Probability	Low (4)	Improbable (2)
Significance	Medium (36)	Low (14)
Status (positive or negative)	Negative	Negative
Reversibility	Low	Low
Irreplaceable loss of resources?	Yes	No
Can impacts be mitigated?	Yes	N/A
Mitigation:		
<ul style="list-style-type: none"> • Maintenance must be undertaken regularly on all vehicles and maintenance machinery to prevent hydrocarbon spills; • No domestic and other waste must be left at the site and must be transported with the maintenance vehicles to an authorised waste dumping area; and • Regularly monitor areas alongside the roads, parking area and workshop for any signs of oil, grease and fuel spillage or the presence of waste. 		
Residual Impacts:		
The residual impact from the operation of the proposed project will be low to negligible.		
Cumulative Impacts:		
The operation of any additional infrastructure to strengthen and support the operation of the Aristida PV facility and waste not removed to designated waste sites will increase the cumulative impacts associated with soil pollution in the area.		

10.2.3 Decommissioning phase

The decommissioning phase will have the same impacts as the construction phase i.e. soil erosion, soil compaction and soil pollution. It is anticipated that the risk of soil erosion will especially remain until the vegetation growth has re-established in the area where the project infrastructure was decommissioned.

10.3 Cumulative impact assessment and rating

“Cumulative Impact”, in relation to an activity, means the past, current and reasonably foreseeable future impact of an activity, considered together with the impact of activities associated with that activity that in itself may not be significant, but may become significant when added to existing and reasonably foreseeable impacts eventuating from similar or diverse activities¹.

¹ Unless otherwise stated, all definitions are from the EIA Regulations 2014 (GNR 326).

The role of the cumulative assessment is to test if such impacts are relevant to the proposed project in the proposed location (i.e. whether the addition of the proposed project in the area will increase the impact). This section should address whether the construction of the proposed project will result in:

- unacceptable risk;
- unacceptable loss;
- complete or whole-scale changes to the environment or sense of place; and
- unacceptable increase in impact.

The proposed project will be located within a 50km radius of other PV facilities that may result in cumulative impacts. The position of these facilities are indicated in Figure 13. The cumulative impacts of the proposed project in addition to the authorised solar developments are rated and discussed below.

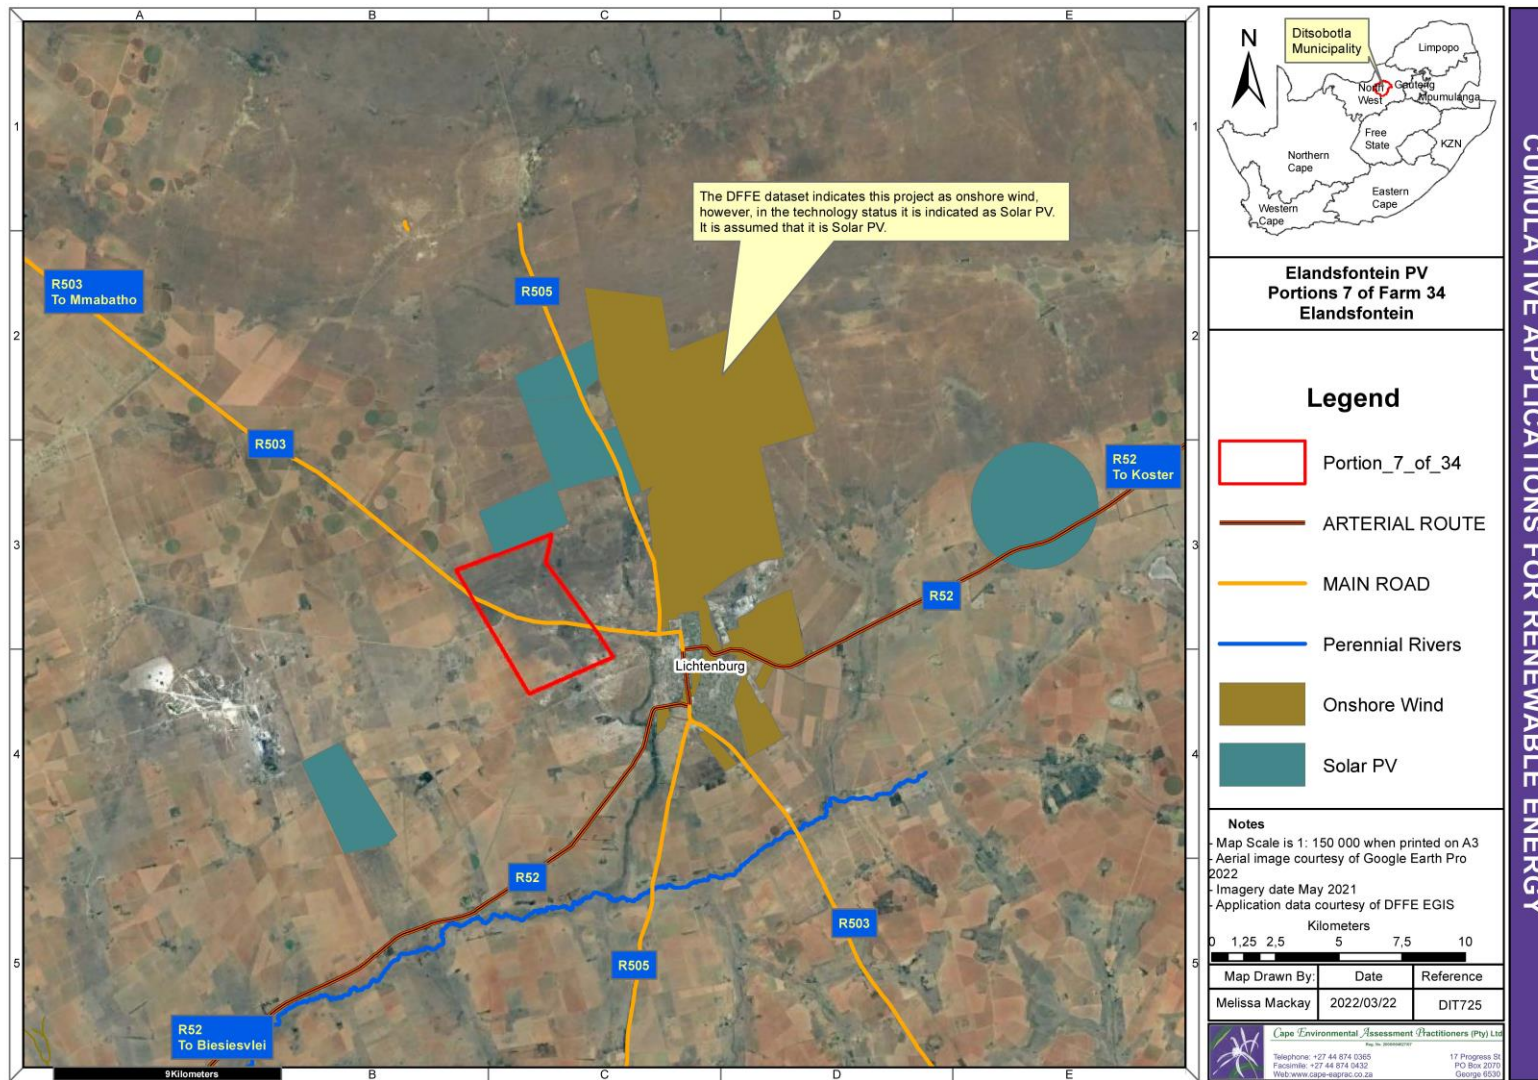

Figure 13 Renewable energy projects within a 50 km radius around the proposed Aristida PV Facility and associated infrastructure

Table 2 Assessment of cumulative impact of decrease in areas available for livestock farming

Nature: Decrease in areas with suitable land capability for cattle farming.		
	Overall impact of the proposed project considered in isolation	Cumulative impact of the project and other projects in the area
Extent	Local (1)	Regional (2)
Duration	Short duration - 2-5 years (2)	Long-term (4)
Magnitude	Low (4)	Low (4)
Probability	Highly likely (4)	Highly likely (4)
Significance	Low (28)	Medium (40)
Status (positive/negative)	Negative	Negative
Reversibility	High	Low
Loss of resources?	Yes	Yes
Can impacts be mitigated?	Yes	No
Confidence in findings: High.		
Mitigation: The only mitigation measure for this impact is to keep the footprints of all renewable energy facilities as small as possible and to manage the soil quality by avoiding far-reaching soil degradation such as erosion.		

Table 3 Assessment of cumulative impact of areas susceptible to soil erosion

Nature: Increase in areas susceptible to soil erosion		
	Overall impact of the proposed project considered in isolation	Cumulative impact of the project and other projects in the area

Loss of resources?	Yes	Yes
Can impacts be mitigated?	Yes	No
Confidence in findings: High.		
Mitigation: Each of the projects should adhere to the highest standards for soil pollution prevention and management, as defined in Sections 11.1.1 and 11.1.2. above.		

11 Mitigation and management measures

The objective of the mitigation and management measures presented below is to reduce the risk of soil degradation that will in turn affect the ability of soils within the project site to support the natural vegetation and provide ecosystem services.

Prevention and management of soil erosion:

Project component/s	<ul style="list-style-type: none"> • Construction of infrastructure • Construction of the access road
Potential Impact	Soil particles can be removed from the area through wind and water erosion
Activity/risk source	The removal of vegetation in areas where infrastructure will be constructed.
Mitigation: Target/Objective	To avoid the onset of soil erosion that can spread into other areas

Mitigation: Action/control	Responsibility	Timeframe
<ul style="list-style-type: none"> • Limit vegetation clearance to only the areas where the surface infrastructure will be constructed. 	Environmental Officer / SHEQ division	During the entire construction, operational and decommissioning phases

<ul style="list-style-type: none"> • Avoid parking of vehicles and equipment outside of designated parking areas. • Plan vegetation clearance activities for dry seasons (late autumn, winter and early spring). • Design and implement a Stormwater Management System where run-off from surfaced areas is expected. • Re-establish vegetation along the access road to reduce the impact of run-off from the road surface. 		
--	--	--

Performance Indicator	No visible signs of soil erosion around the project infrastructure
Monitoring	<ul style="list-style-type: none"> • Regular inspections around the constructed infrastructure to detect early signs of soil erosion developing. • When signs of erosion are detected the areas must be rehabilitated, using a combination of geo-textiles and re-vegetation to prevent the eroded area(s) from expanding.

Prevention and management of soil pollution:

Project component/s	<ul style="list-style-type: none"> • Construction of infrastructure • Daily activities and maintenance during the operational phase
Potential Impact	Potential fuel and oil spills from vehicles and waste generation can cause soil pollution.
Activity/risk source	<ul style="list-style-type: none"> • Petroleum hydrocarbon (present in oil and diesel) spills by machinery and vehicles during earthworks and the removal of vegetation as part of site preparation. • Spills from vehicles transporting workers, equipment, and construction material to and from the construction site. • The accidental spills from temporary chemical toilets used by construction workers. • The generation of domestic waste by construction workers. • Spills from fuel storage tanks during construction. • Pollution from concrete mixing. • Pollution from road-building materials. • Any construction material remaining within the construction area once construction is completed. • Containment breaches related to the battery units and any inadvertent chemical exposure therefrom.
Mitigation: Target/Objective	To avoid soil pollution that can harm the surrounding environment and human health.

Mitigation: Action/control	Responsibility	Timeframe
<ul style="list-style-type: none"> • Maintenance must be undertaken regularly on all vehicles and construction/maintenance machinery to prevent hydrocarbon spills. 	Environmental Officer / SHEQ division	During the entire construction, operational and decommissioning phases

<ul style="list-style-type: none"> • Any waste generated during construction must be stored in designated containers and removed from the site by the construction teams. • Any left-over construction materials must be removed from site. • Ensure battery transport and installation by accredited staff / contractors. • Compile (and adhere to) a procedure for the safe handling of battery cells during transport and installation. 		
--	--	--

Performance Indicator	<ul style="list-style-type: none"> • No visible signs of waste and spills within the project site. • No accumulation of contaminants in the soils of the project site.
Monitoring	<ul style="list-style-type: none"> • Regular inspections of vehicles and equipment that enter the project site. • Analysis of soil samples around high-risk areas to determine whether soil contaminants are present. • In the case that soil pollution is detected, immediate remediation must be done.

12 Acceptability statement

Following the data analysis and impact assessment above, the proposed Aristida PV facility and Associated Infrastructure is considered an acceptable development within the area that was assessed for the purpose of compiling the Agricultural Assessment Report.

The soil forms present within the development area consist of shallow Mispah soils underlain by rock that has severe limitations to rainfed crop production as well as Carolina, Clovelly and Vaalbos soils with effective depth between 0.4m and 0.8m. Even though the effective depth of the Carolina, Clovelly and Vaalbos soils are deeper than that of the Mispah soils, the areas where these soils are shallower than 0.6m, is still not considered suitable for rainfed crop production.

The landowner of the development area has indicated that crop farming was ceased in 1994 in the area where the Carolina, Clovelly and Vaalbos soils are present and Smuts finger grass was established here in in 1995. The reason for the conversion from crop production to livestock farming in the crop field area in the north western corner of the development area, was the low crop yield obtained. The land use of the entire development area is livestock farming since 1995.

There is no irrigation infrastructure, such as centre pivots or drip irrigation, present within the project area. The grazing capacity (according to DALRRD, 2018), is 8ha/LSU, indicating that the proposed development area of 251 ha has forage to feed 31 head of cattle.

Following the analysis of the baseline data, the development area was assigned a sensitivity rating. The 133.5 ha of shallow Mispah soils have Low agricultural sensitivity and the areas with deeper soil profiles (total area of 108.5 ha), have Medium agricultural sensitivity .

It is anticipated that the construction and operation of the Aristida PV facility and Associated Infrastructure will have impacts that range from medium to low. Through the consistent implementation of the recommendation mitigation measures, most of impacts can all be reduced to low.

Considering that the project infrastructure components will be placed close to each other and not interfere with the nearby High Potential Agricultural Areas that have delineated over neighbouring farm portions, I confirm that all reasonable measures have been taken to avoid or minimize fragmentation and disturbance of agricultural activities, provided that the mitigation measures provided in this report are implemented.

It is my professional opinion that this application be considered favourably, permitting that the mitigation measures are followed to prevent soil erosion and soil pollution and to minimise impacts on the veld quality of the farm portions that will be affected. The project infrastructure should also remain within the proposed project area that will be fenced off.

PROFESSIONAL PROFILE

I contribute specialist knowledge on agriculture and soil management to ensure long-term sustainability of projects in Africa. For the past thirteen years, it has been my calling and I have consulted on more than 200 projects. My clients include environmental and engineering companies, mining houses, and project developers. I enjoy the multi-disciplinary nature of the projects that I work on and I am fascinated by the evolving nature of my field of practice. The next section provide examples of the range of projects completed. A comprehensive project list is available on request.

PROJECT EXPERIENCE

Global Assessment on Soil Pollution

Food and Agricultural Organisation (FAO) of the United Nations (UN)

Author of the regional assessment of Soil in Sub-Saharan Africa. The report is due for release in February 2021. The different sections included:

- Analysis of soil and soil-related policies and guidelines for each of the 48 regional countries
- Description of the major sources of soil pollution in the region
- The extent of soil pollution in the region and as well as the nature and extent of soil monitoring
- Case study discussions of the impacts of soil pollution on human and environmental health in the region
- Recommendations and guidelines for policy development and capacitation to address soil pollution in Sub-Saharan Africa

Data Consolidation and Amendment

Range of projects: Mining Projects, Renewal Energy

These projects included developments where previous agricultural and soil studies are available that are not aligned with the current legal and international best practice requirements such as the IFC Principles. Other projects are expansion projects or changes in the project infrastructure layout. Tasks on such projects include the incorporation of all relevant data, site verification, updated baseline reporting and alignment of management and monitoring measures.

Project examples:

- Northam Platinum's Booyendal Mine, South Africa
- Musonoi Mine, Kolwezi District, Democratic Republic of Congo
- Polihali Reservoir and Associated Infrastructure, Lesotho
- Kaiha 2 Hydropower Project, Liberia
- Aquarius Platinum's Kroondal and Marikana Mines

PROJECT EXPERIENCE (Continued)

Agricultural Agro-Ecosystem Assessments

Range of projects: Renewable Energy, Industrial and Residential Developments, Mining, Linear Developments (railways and power lines)

The assessments were conducted as part of the Environmental and Social Impact Assessment processes. The assessment process includes the assessment of soil physical and chemical properties as well as other natural resources that contributes to the land capability of the area.

Project examples:

- Mocuba Solar PV Development, Mozambique
- Italthai Railway between Tete and Quelimane, Mozambique
- Lichtenburg PV Solar Developments, South Africa
- Manica Gold Mine Project, Mozambique
- Khunab Solar PV Developments near Upington, South Africa
- Bomi Hills and Mano River Mines, Liberia
- King City near Sekondi-Takoradi and Appolonia City near Accra, Ghana
- Limpopo-Lipadi Game Reserve, Botswana
- Namoya Gold Mine, Democratic Republic of Congo

Sustainable Agriculture

Range of projects: Policy Development for Financial Institutions, Mine Closure Planning, Agricultural Project and Business Development Planning

Each of the projects completed had a unique scope of works and the methodology was designed to answer the questions. While global indicators of sustainable agriculture are considered, the unique challenges to viable food production in Africa, especially climate change and a lack of infrastructure, in these analyses.

Project examples:

- Measurement of sustainability of agricultural practices of South African farmers – survey design and pilot testing for the LandBank of South Africa
- Analysis of the viability of avocado and mango large-scale farming developments in Angola for McKinsey & Company
- Closure options analysis for the Tshipi Borwa Mine to increase agricultural productivity in the area, consultation to SLR Consulting
- Analysis of risks and opportunities for farm feeds and supplement suppliers of the Southern African livestock and dairy farming industries
- Sustainable agricultural options development for mine closure planning of the Camutue Diamond Mine, Angola

PROJECT EXPERIENCE (Continued)

Soil Quality Assessments

*Range of projects: Rehabilitated Land Audits, Mine Closure Applications,
Mineral and Ore Processing Facilities, Human Resettlement Plans*

The soil quality assessments included physical and chemical analysis of soil quality parameters to determine the success of land rehabilitation towards productive landscapes. The assessments are also used to understand the suitability for areas for Human Resettlement Plans

Project examples:

- Closure Planning for Yoctolux Colliery
- Soil and vegetation monitoring at Kingston Vale Waste Facility
- Exxaro Belfast Resettlement Action Plan Soil Assessment
- Soil Quality Monitoring of Wastewater Irrigated Areas around Matimba Power Station
- Keaton Vanggatfontein Colliery Bi-Annual Soil Quality Monitoring
